

# Development of a Methodological Approach to Strategic Fire Service Planning Combining Concepts of Risk, Hazard and Scenario-based Design

**PSAM12**

**Hawaii, 23 June 2014**

Ing. Adrian Ridder, M.Sc., MIFireE

Prof. Dr.-Ing. Uli Barth

# Contents

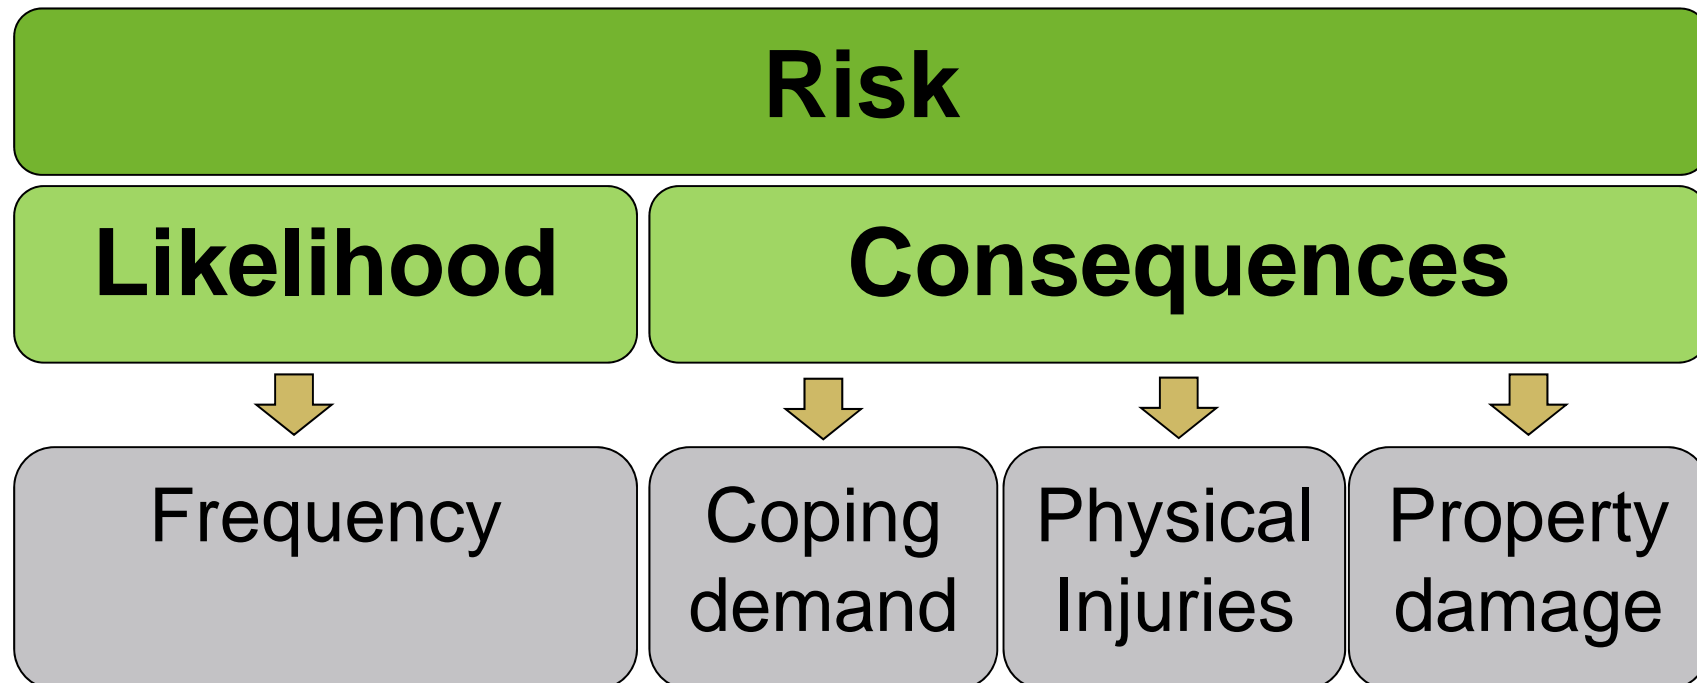

- Project Background
- Empirical foundation: Analysis of fire service incident data
- Methodology for strategic fire service planning
  - Hazard-based approach
  - Risk-based approach
  - Scenario approach
- Conclusions
- References

## Project „TIBRO“

- = Tactical-strategic Innovative Risk-based Fire Service Planning
- ORBIT (1970s study still referenced and used today)
- Funded by the German Federal Ministry of Education and Research
- From April 2012 to March 2015
- **Objective:** scientific foundations for public fire service planning adaptive for future challenges
  
- Need for fundamental research

## Analysis of fire service incident data

- Hypotheses on risks of different settlement structures in existing planning methods
- Operationalisation of risk:

# Analysis of fire service incident data

- Hypotheses on risks of different settlement structures in existing planning methods

Parameter Risk factor	Height of building	occupancy	Construc- tion type	age of building	category of street
Coping demand	High	High	High	High	High
Property damage	High	High	High	High	Low
Physical injury	High	High	High	High	High
Frequency	High	High	High	High	High

## Sample municipalities

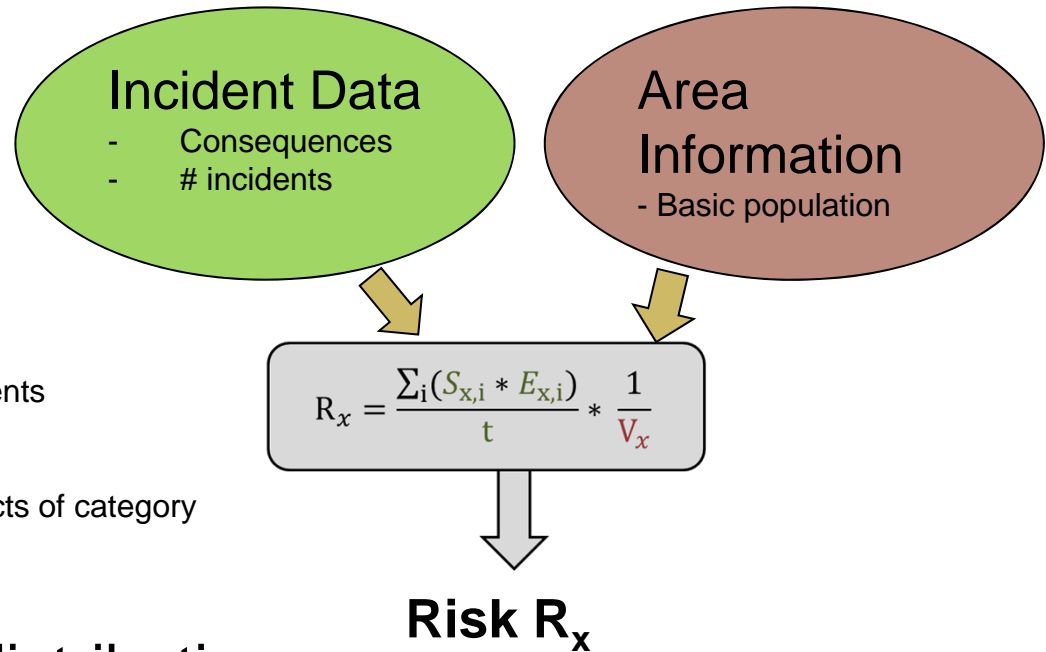

- **City 1:** pop. ca. 350.000, 5 years of data, 1.022 data sets (structure fires only) [18]
- **City 2:** pop. ca. 690.000, 4 years of data, 17.093 data sets [17]
- **County\*:** pop. ca. 305.000, 2.75 years of data, 330 data sets [19]
- **Fire service data**
  - Logs from control rooms
  - Incident action reports
- **Additional data**
  - Number of buildings, km in each category
  - Type of building per street address

\* Not in paper, manual data collection

# Analysis methods

## ■ Calculation of risk numbers

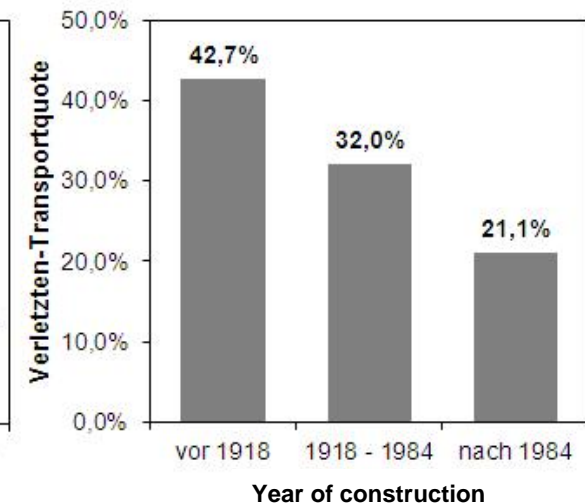

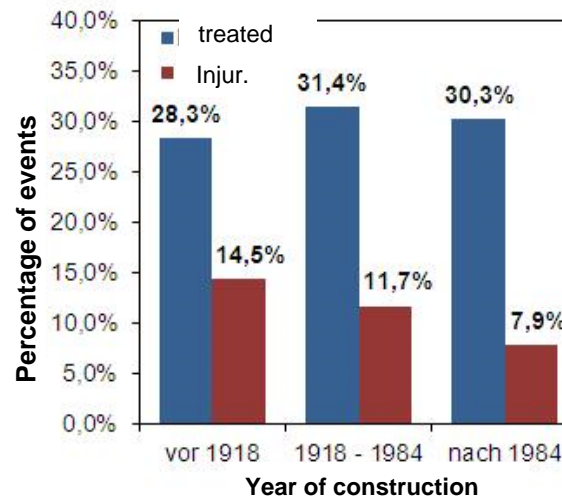

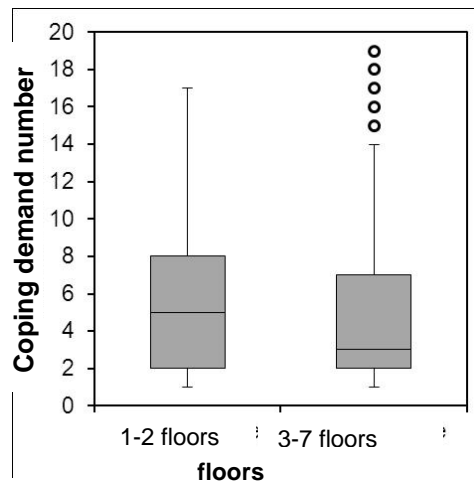

City 2

E= number of incidents  
 S= Loss  
 t = time frame  
 V = number of objects of category

## ■ Comparison of statistical distributions

City 1  
 County

# Results of Data Analysis

## ■ City 1

-  Hypothesis falsified
-  Hypothesis proved
-  Insufficient data
-  No data available

Parameter	Height of building	occupancy	Construction type	age of building	category of street
Risk factor					
Coping demand					
Property damage					
Physical injury					
Frequency					

# Results of Data Analysis

## ■ City 2

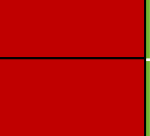

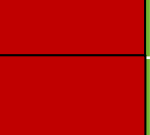

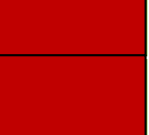

-  Hypothesis falsified
-  Hypothesis proved
-  Insufficient data
-  No data available

Parameter	Height of building	occupancy	Construction type	age of building	category of street
Risk factor					
Coping demand					
Property damage					
Physical injury					
Frequency					

# Results of Data Analysis

## ■ County

-  Hypothesis falsified
-  Hypothesis proved
-  Insufficient data
-  No data available

Parameter	Height of building	occupancy	Construction type	age of building	category of street
Risk factor					
Coping demand					
Property damage		 			
Physical injury		 			 
Frequency		 			 

# Results of Data Analysis

- Inconclusive results
- Proof of principle
- Cross-checking methodologies
- Issues
  - municipal responsibility
  - statistical population (too) small
  - varying data collection procedures  
by fire services
  - incomplete data sets  
(e.g. the building age)

Parameter	Height of building	occupancy	Construction type	age of building	category of street
<b>Risk factor</b>					
Coping demand	Yellow	Yellow	Red	Green	Grey
Property damage	Yellow	Yellow	Red	Green	Grey
Physical injury	Yellow	Yellow	Red	Green	Grey
Frequency	Yellow	Yellow	Red	Green	Grey
<b>Risk factor</b>					
Coping demand	Green	Green	Green	Grey	Grey
Property damage	Green	Green	Green	Grey	Grey
Physical injury	Grey	Grey	Grey	Grey	Grey
Frequency	Green	Green	Green	Grey	Grey
<b>Risk factor</b>					
Coping demand	Grey	Yellow	Grey	Grey	Yellow
Property damage	Grey	Green	Red	Grey	Grey
Physical injury	Grey	Green	Red	Grey	Green
Frequency	Grey	Green	Red	Grey	Green

# Risk-based Strategic Fire Service Planning

- Many hazard-based methodologies available
- „Risk = f (P, C)“
- Paradox of probabilities:
  - Lim  $\rightarrow 0$  but still need to preplan for seldom events
  - Low probability/high impact events
  - No residential fire for communities < pop. 18,750? „P = 0“ (6 yrs) [9]
- In Germany no approved risk acceptance criteria
- „How safe is safe enough“?
  - No valid scientific answer possible
  - Ethical considerations  $\rightarrow$  political decision-making based on scientific foundations (Analytic-deliberative approach [11])

# Scenario Approach

- reduce virtually infinite number of incidents to a manageable number
- Questions:
  - Necessary number of scenarios
  - Criteria for selecting scenarios
    - Frequency
    - Criticality (spectrum from worst to simplest case)
    - ...?

# Criterion: Frequency (?)

**Number of scenarios = f (frequency, scenario type, scenario size)**

## Conclusions

- Risk-based approach appropriate
- Goal: Determine adequate level of risk (spending, safety)
- fundamental research necessary on risk characteristics
- Valid data base required (lack of national fire service statistic)
- Studies with city data confirmed principle of fire service data analysis for risk research

# Thank you
